Handover to the Dialysis Unit

John Ross: brief episodes of unresponsiveness when he is moved

For the attention of the treating team, Dialysis Unit, The Northern Hospital (Epping).

Patient	John Eric Ross | DOB 30/12/1961 | NDIS 574479496
Dialysis	Haemodialysis, Tuesday / Thursday / Saturday, 2:30 PM, transported by ambulance
Resuscitation	**Full code** (for resuscitation)
From	One Life Foundation, Supported Independent Living provider
Contact	Swosthani Thapa, Operations Manager | 0457 347 882 | swos@olfndisservices.com.au
Date	29 September 2026

Reason for this handover

Support workers have noticed **several episodes where John becomes unresponsive for several seconds when he is moved**. These have happened during bed care and transfers, for example pad changes, bed sheet changes, repositioning and hoist transfers. During these episodes John stops moving and does not respond to his name. He has been observed to keep breathing. **During one episode, staff noticed his eyes rolling.** Afterwards he has told staff his **head was spinning** or that he felt **dizzy**.

This handover is to make the unit aware of what staff have noticed.

Observations recorded in John's notes

27/05/2026	During a bed sheet change John showed no movement for about half a minute; when asked, he said his head was spinning. Later the same morning, after a hoist transfer with his OT and physiotherapist, he reported sudden dizziness. Two episodes of unresponsiveness were recorded that day (incident INC-202605-006) and his wife was informed.
15/06/2026	During a transfer with his physiotherapist and OT, blood pressure was recorded as **157/98** before, and **112/57** after John was moved to the chair.
02/09/2026	Hoist transfer with the physiotherapist to the commode and chair. Blood pressure was checked three times and did not drop.
09/09/2026	Hoist transfers with the physiotherapist (commode, bed, chair). Blood pressure was checked and stayed steady during the transfers.
25/09/2026	John reported feeling giddy in the morning, and was drowsy for the rest of the day.

Relevant background from John's records

- Type 2 diabetes mellitus (Novorapid and Optisulin insulin), end stage kidney disease on haemodialysis, and severe diabetic peripheral neuropathy.
- Suprapubic catheter in situ. Multiple lower limb and abdominal wounds; high risk of pressure injury.
- Non-ambulant. Two staff for all bed mobility; hoist transfers are done with his physiotherapist.
- His community physiotherapist's note of 29/07/2026 lists a drop in blood pressure leading to fainting as one of the risks when John is hoisted out of bed. His OT has trialled a tilt-in-space commode for this reason.

- His hospital passport records a history of unresponsiveness for a few seconds during transfers.
